Gastritis

Minisymposium: Patológia Gastrointestinálneho Traktu
SD-IAP, Košice, Slovakia, 6-7 June 2019

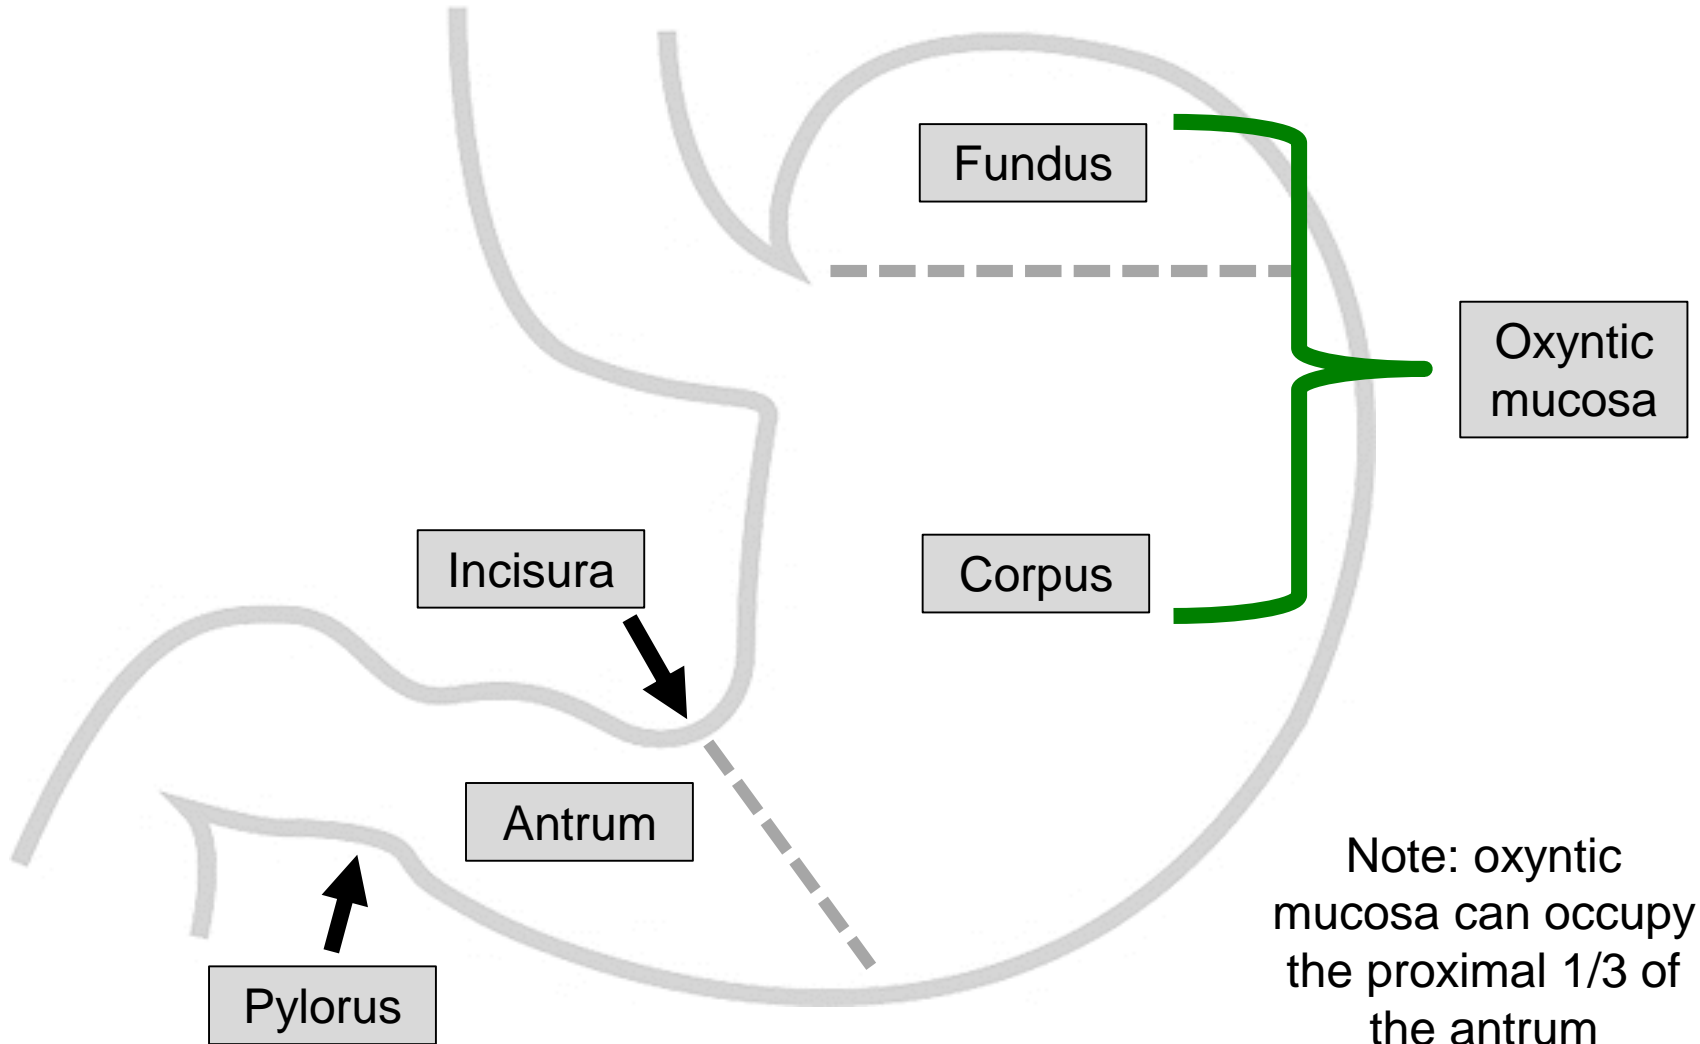

Cord Langner MD
Diagnostic & Research Centre for Molecular
BioMedicine
Institute of Pathology
Medical University of Graz, Austria

Agenda

- **The normal stomach**
- **Definition of gastritis**
- **The aetiological alphabet of gastritis**
 - **A** utoimmune gastritis
 - **B** acterial gastritis (HP-Gastritis)
 - **C** hemical gastritis (reactive gastropathy)
 - **D** istinct other types of gastritis
- **Grading und staging of chronic gastritis**
- **Take home message**

The normal stomach

The normal antrum

The normal antrum

Normal: approximately four G cells per crypt (barely visible on H&E)

Under PPI > four G cells with some crowding (easily visible on H&E)

The normal corpus

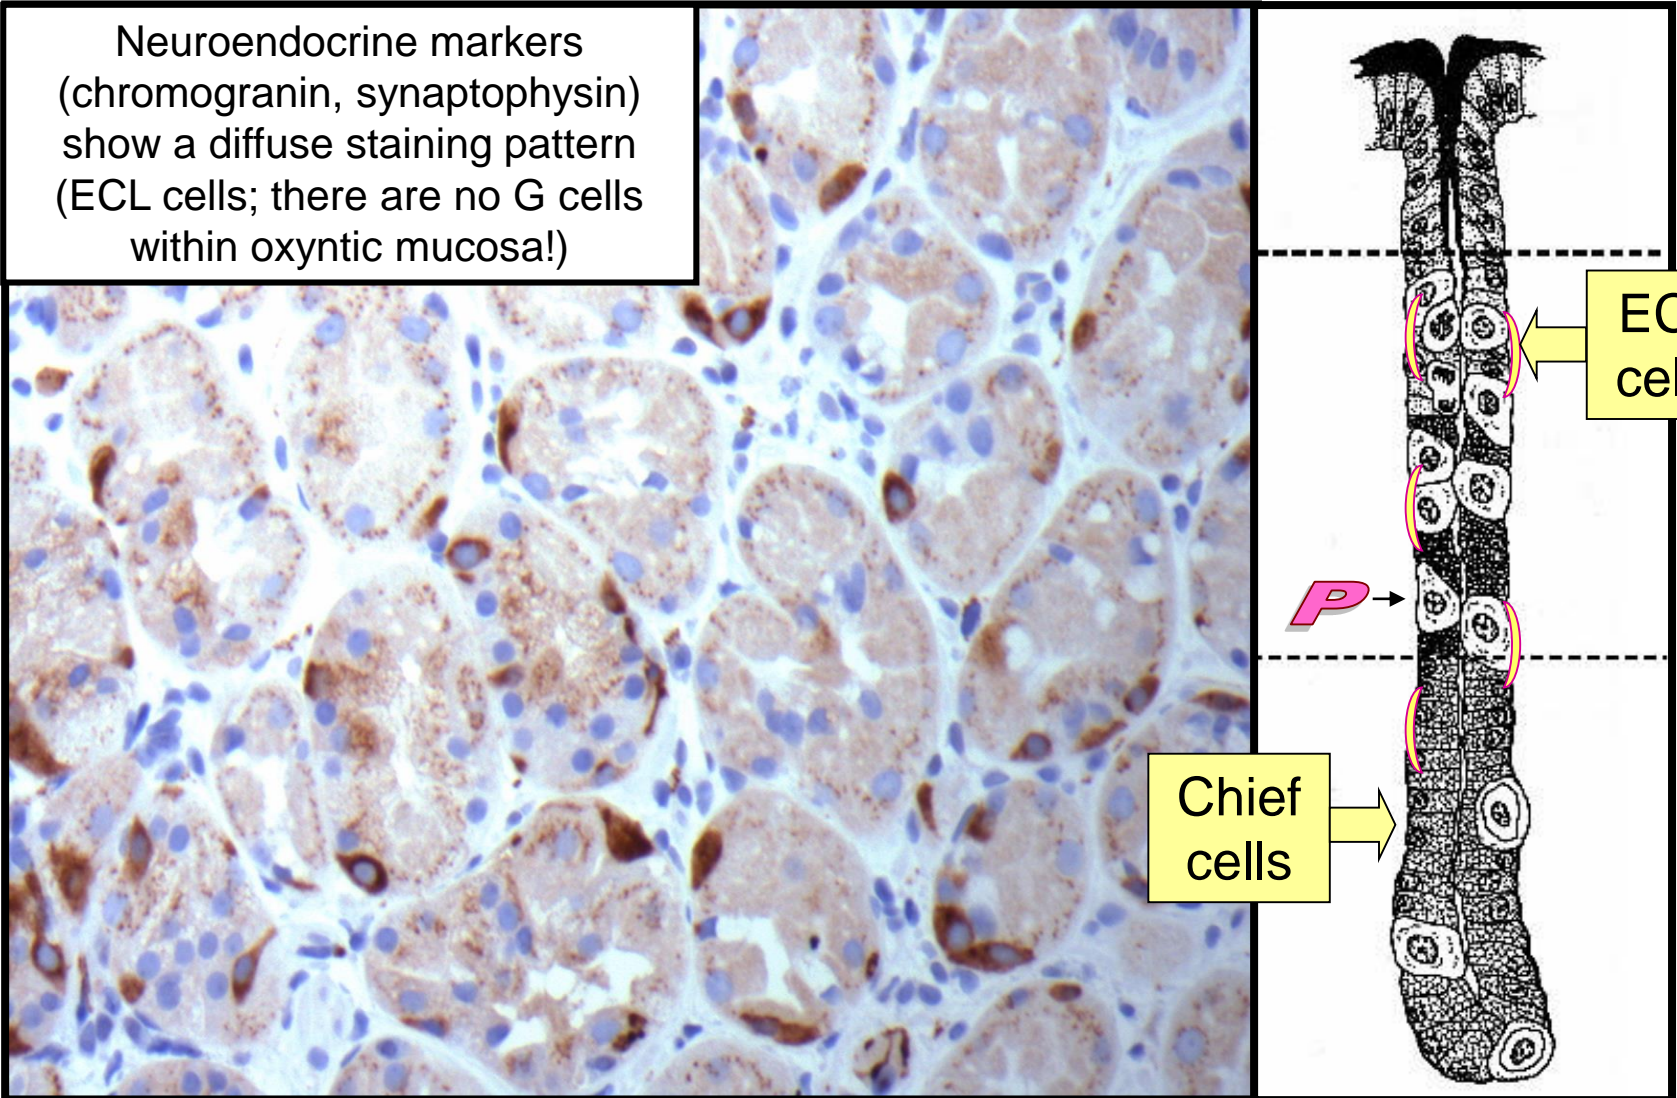

The normal corpus

The normal corpus

Neuroendocrine markers (chromogranin, synaptophysin) show a diffuse staining pattern (ECL cells; there are no G cells within oxyntic mucosa!)

Definition of Gastritis:

“Histological proof of gastric mucosa inflammation”

Professor Peter Malfertheiner
Gastroenterologist
Magdeburg, Germany

Kyoto global consensus report on *Helicobacter pylori* gastritis

Medizinische Universität Graz

Kentaro Sugano,¹ Jan Tack,² Ernst J Kuipers,³ David Y Graham,⁴ Emad M El-Omar,⁵ Soichiro Miura,⁶ Ken Haruma,⁷ Masahiro Asaka,⁸ Naomi Uemura,⁹ Peter Malfertheiner,¹⁰ on behalf of faculty members of Kyoto Global Consensus Conference

Box 3 Aetiology-based classification of gastritis (3A) and duodenitis (3B). A proposal according to the consensus at the Kyoto consensus conference

3A Proposed classification of gastritis in the Kyoto consensus conference

Autoimmune gastritis

Infectious gastritis

- ▶ *Helicobacter pylori*-induced gastritis
- ▶ Bacterial gastritis other than *H. pylori*
 - Helicobacter heilmannii* gastritis
 - Enterococcus gastritis
 - Mycobacteria gastritis
 - Secondary syphilitic gastritis
- ▶ Gastric phlegmone
- ▶ Viral gastritis
 - Enteroviral gastritis
 - Cytomegalovirus gastritis
- ▶ Fungal gastritis
 - Gastritis due to mucormycosis
 - Gastric candidiasis
 - Gastric histoplasmosis
- ▶ Parasitic gastritis
 - Cryptosporidium gastritis
 - Gastric *strongyloides stercoralis*
 - Gastric anisakiasis

Gastritis due to external causes

- ▶ Drug-induced gastritis
- ▶ Alcoholic gastritis
- ▶ Radiation gastritis
- ▶ Chemical gastritis
- ▶ Gastritis due to duodenal reflux
- ▶ Gastritis due to other specified external cause

Gastritis due to specified causes

- ▶ Lymphocytic gastritis
- ▶ Ménétrier disease
- ▶ Allergic gastritis
- ▶ Eosinophilic gastritis

Gastritis due to other diseases classified elsewhere

- ▶ Gastritis due to sarcoidosis
- ▶ Gastritis due to vasculitis
- ▶ Gastritis due to Crohn's disease

3B Proposed classification of duodenitis in the Kyoto consensus conference

Infectious duodenitis

- ▶ *H. pylori*-induced duodenitis
- ▶ Bacterial duodenitis other than *H. pylori*
 - Mycobacterial duodenitis
 - Duodenitis due to *Tropheryma whippelii* (Whipple's disease)
- ▶ Duodenal phlegmone
- ▶ Fungal duodenitis
 - Duodenal candidiasis
- ▶ Parasitic duodenitis
 - Ancylostomiasis (hookworm) duodenitis
 - Duodenal anisakiasis
 - Duodenitis due to *Giardia lamblia*
 - Strongyloides duodenitis
- ▶ Viral duodenitis
 - Cytomegaloviral duodenitis
 - Herpetic duodenitis

Duodenitis due to external causes

- ▶ Alcoholic duodenitis
- ▶ Chemical duodenitis
- ▶ Radiation duodenitis
- ▶ Duodenitis due to other external causes
- ▶ Drug-induced duodenitis

Duodenitis due to specified causes

- ▶ Allergic duodenitis
- ▶ Eosinophilic duodenitis
- ▶ Lymphocytic duodenitis

Duodenitis due to other diseases classified elsewhere

- ▶ Duodenitis due to Crohn's disease
- ▶ Duodenitis due to sarcoidosis
- ▶ Duodenitis due to vasculitis
- ▶ Duodenitis due to Henoch–Schönlein purpura
- ▶ Duodenitis due to coeliac disease

Alimentary Tract

Changing prevalence patterns in endoscopic and histological diagnosis of gastritis? Data from a cross-sectional Central European multicentre study

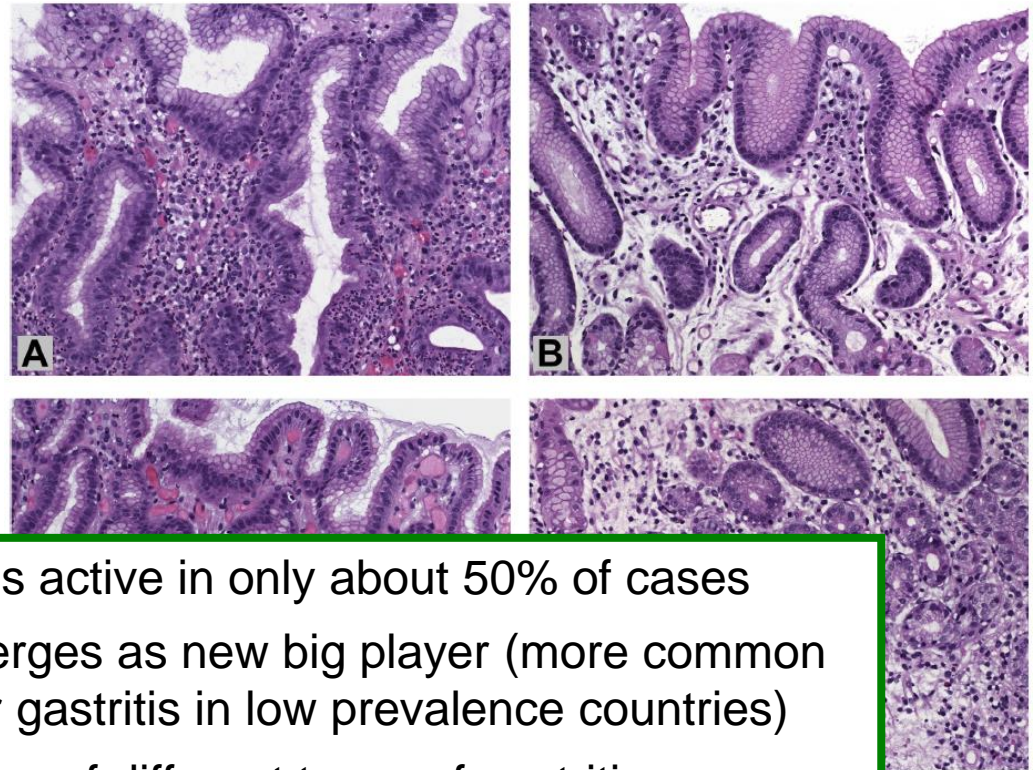

Eva-Maria Wolf^a, Wolfgang Plieschnegger^b, Michael Geppert^c, Bernd Wigglinghaus^d, Gabriele M. Höss^e, Andreas Eherer^f, Nora I. Schneider^a, Almuthe Hauer^g, Peter Rehak^h, Michael Viethⁱ, Cord Langner^{a,*}

E.-M. Wolf et al. / Digestive and Liver Disease 46 (2014) 412–418

Table 2
Histological diagnosis of gastritis.

Histological type of gastritis	N (%)
<i>Helicobacter</i> gastritis (HG)	210 (18.7%)
HG only	208 (18.5%)
HG + reactive gastropathy	1 (0.1%)
HG + Crohn's disease	1 (0.1%)
Post <i>Helicobacter</i> gastritis (PHG)	215 (19.1%)
PHG only	176 (15.7%)
PHG + reactive gastropathy	21 (1.9%)
PHG + autoimmune gastritis	11 (1%)
PHG + reactive gastropathy + autoimmune gastritis	6 (0.5%)
PHG + Crohn's disease	1 (0.1%)
Reactive gastropathy (RG)	234 (20.8%)
RG only	201 (17.1%)
RG + post <i>Helicobacter</i> gastritis	21 (1.9%)
RG + post <i>Helicobacter</i> gastritis + autoimmune Gastritis	6 (0.5%)
RG + autoimmune gastritis	5 (0.4%)
RG + <i>Helicobacter</i> gastritis	1 (0.1%)
Autoimmune gastritis (AG)	26 (2.3%)
AG only	
AG + post <i>Helicobacter</i>	
AG + post <i>Helicobacter</i>	
AG + reactive gas	
Crohn's disease (CD)	
CD only	
CD + <i>Helicobacter</i>	
CD + post <i>Helicobacter</i>	

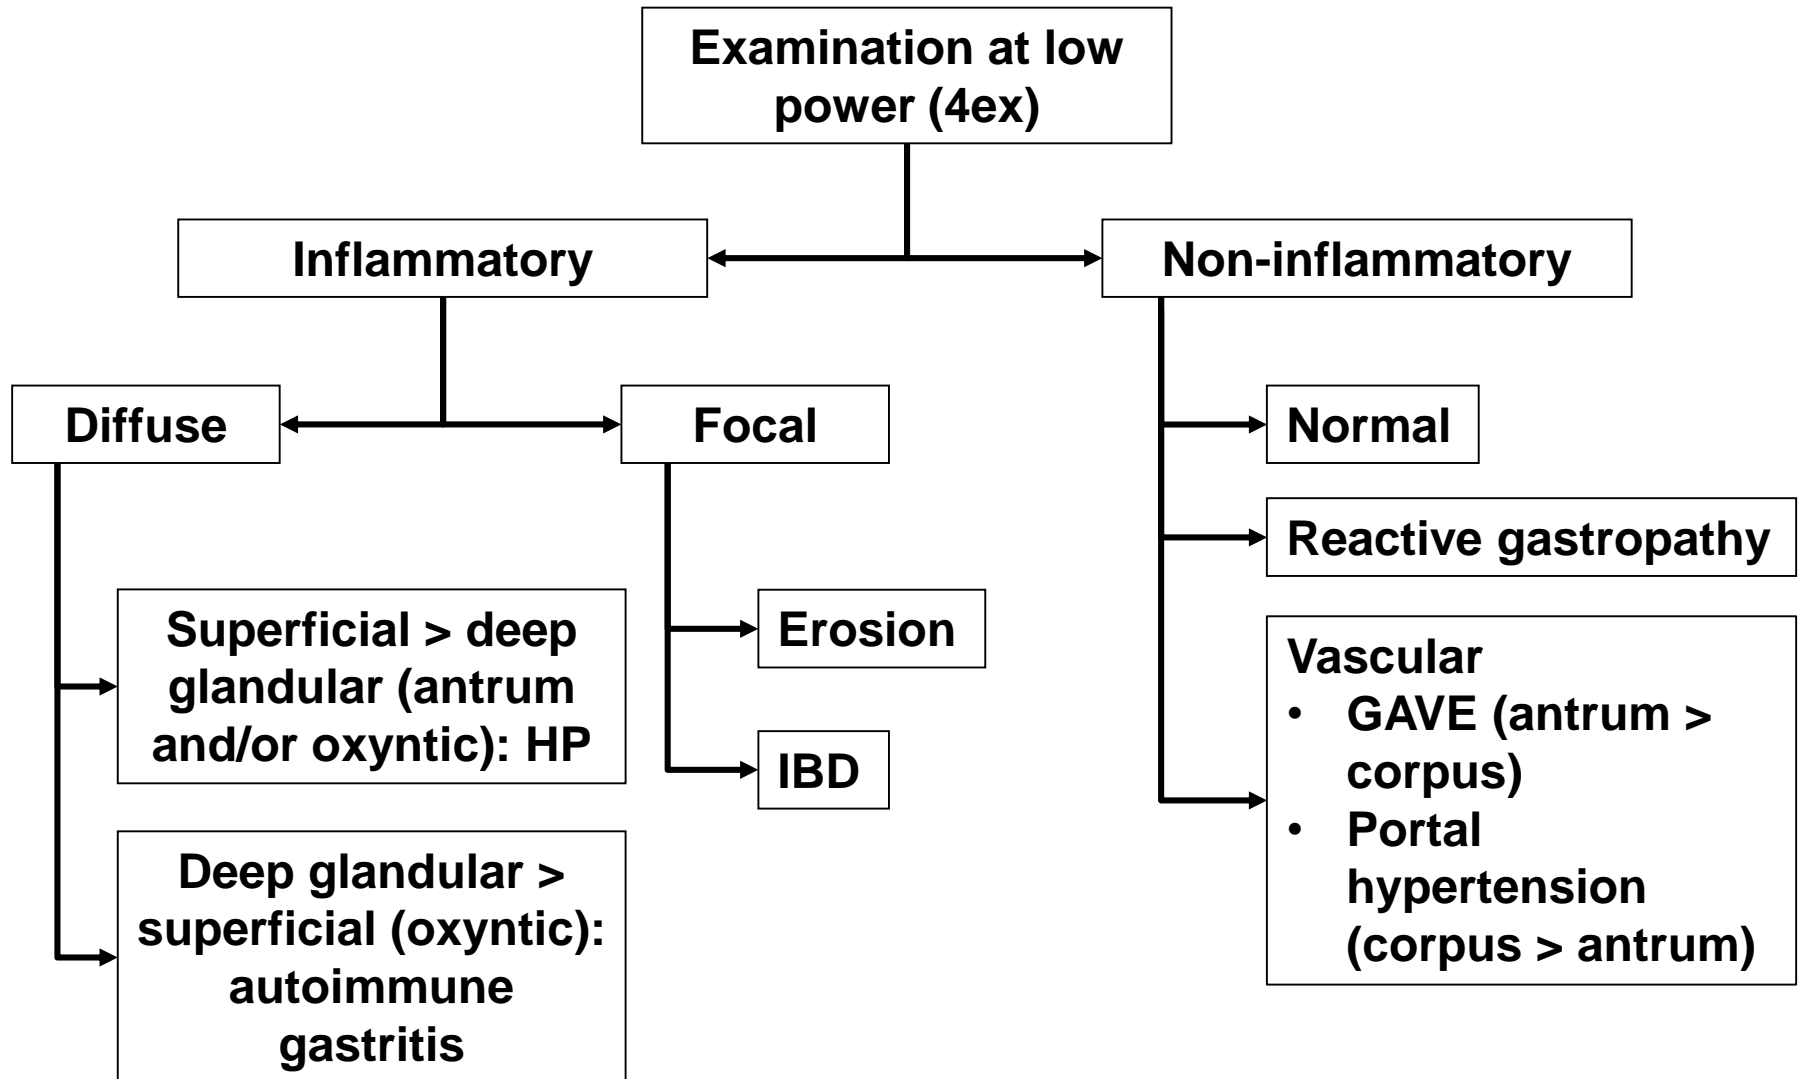

Helicobacter-gastritis is active in only about 50% of cases
 Reactive gastropathy emerges as new big player (more common than active Helicobacter gastritis in low prevalence countries)
 In 7% of cases combinations of different types of gastritis are seen

Abbreviations: HG – *Helicobacter* gastritis
 RG – reactive gastropathy

immune gastritis (D).

Algorithmic approach to the diagnosis of gastritis

Helicobacter gastritis

- Chronic-active inflammation
- Starts in the antrum, but may shift to the corpus (in patients receiving PPIs and/or with intestinal metaplasia)

Helicobacter gastritis

Medizinische Universität Graz

Helicobacter gastritis

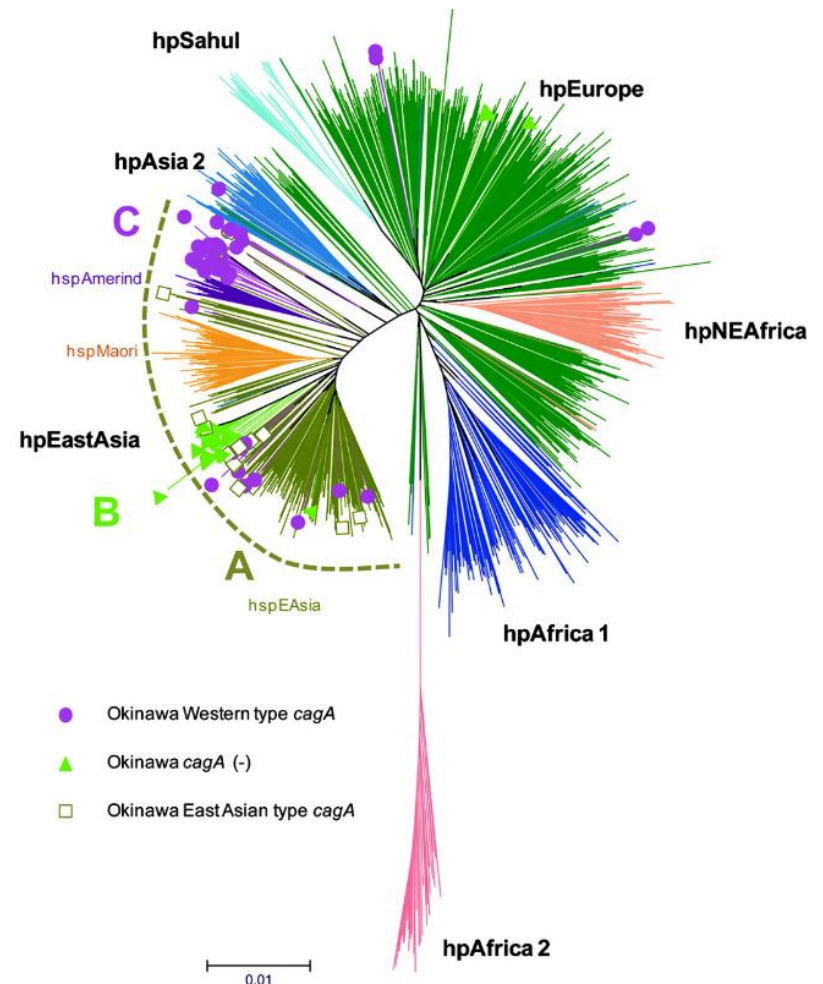

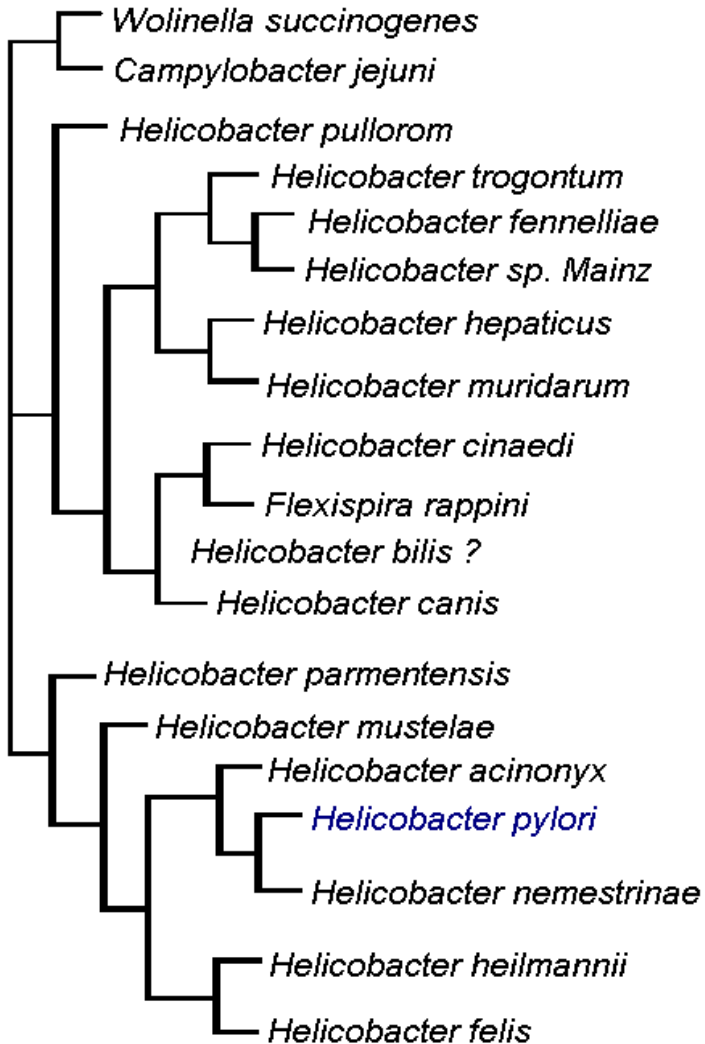

HP gastritis und non-HP helicobacter gastritis

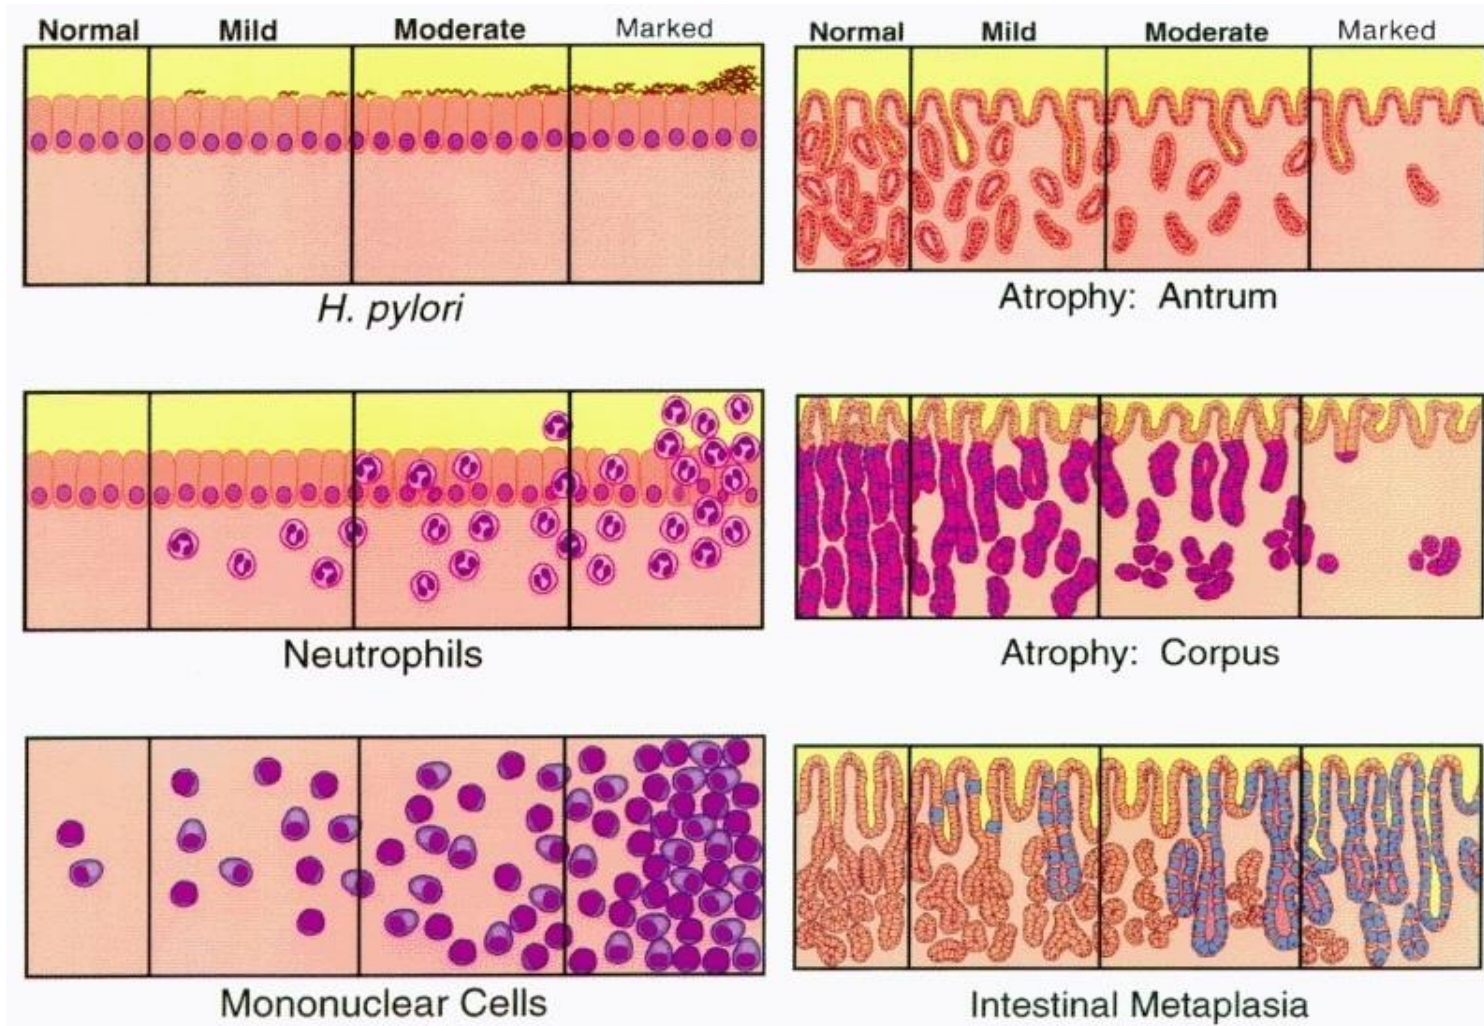

Medizinische Universität Graz

HP gastritis und non-HP helicobacter gastritis

Sydney classification

Post-(or Ex)-HP Gastritis

Medizinische Universität Graz

**Mild chronic inactive gastritis
No HP; the morphology consistent with
post-HP gastritis (ex-HP gastritis)**

Lymphocytic gastritis

Definition: chronic(-active) gastritis with increase of surface intraepithelial lymphocytes (>25 IELs / 100 epithelial cells)

Lymphocytic gastritis

- **Antrum-dominant lymphocytic gastritis**
 - Association with lymphocytic duodenitis or enteritis and villous atrophy (coeliac disease)

The coeliac stomach: gastritis in patients with coeliac disease

B. Lebwohl^{*†}, P. H. R. Green^{*} & R. M. Genta^{‡§}

Table 1 | Characteristics of patients who underwent concurrent gastric and duodenal biopsy during a 6-year period (n = 287 503)

Characteristic	Number (%)
Age, years	
Mean/median (SD)	51.7/53 (18)
0–19	12 415 (4)
20–39	60 360 (21)
40–59	110 210 (38)
≥60	104 518 (36)
Gender*	
Male	96 722 (34)
Female	190 678 (67)
Gastric histology	
Normal	183 325 (64)
Active <i>H. pylori</i> gastritis	27 366 (10)
Chronic active gastritis, <i>H. pylori</i> -negative	4619 (2)
Chronic inactive gastritis	16 155 (6)
Lymphocytic gastritis	818 (0.3)
Reactive gastropathy	46 790 (16)
Intestinal metaplasia	20 223 (7)
Atrophic gastritis	1647 (0.6)
Duodenal histology	
Normal/duodenitis	264 739 (92)
Duodenal intraepithelial lymphocytosis	18 816 (7)
Partial villous atrophy	2062 (0.7)
Subtotal/total villous atrophy	1886 (0.7)

* Gender data missing for 103 patients (0.04%).

Aim

To compare the prevalence of LG, CAG and CIG among those with normal duodenal histology (or nonspecific duodenitis) and those with CD, as defined by villous atrophy (Marsh 3).

Methods

We analysed all concurrent gastric and duodenal biopsy specimens submitted to a national pathology laboratory during a 6-year period. We performed multiple logistic regression to identify independent predictors of each gastritis subtype.

The coeliac stomach: gastritis in patients with coeliac disease

B. Lebwohl^{*†}, P. H. R. Green^{*} & R. M. Genta^{‡§}

Table 2 | Univariate and multivariate analysis of predictors of lymphocytic gastritis

Characteristic	Univariate analysis		Multivariate analysis	
	Prevalence of lymphocytic gastritis	P-value	OR (95% CI)	P-value
Age, years				
0–19	26 (0.2)	<0.0001	0.75 (0.50–1.45)	0.1860
20–39	160 (0.3)		1.0 (ref)	ref
40–59	246 (0.2)		0.94 (0.77–1.53)	0.5632
≥60	386 (0.4)		1.83 (1.51–2.21)	<0.0001
Gender				
Male	288 (0.3)	0.3463	1.0 (ref)	ref
Female	530 (0.3)		0.88 (0.76–1.02)	0.0925
<i>H. pylori</i> status				
<i>H. pylori</i>	65 (0.2)	0.1249	0.87 (0.67–1.12)	0.2765
No <i>H. pylori</i>	753 (0.3)		1.0 (ref)	ref
Duodenal histology				
Normal/duodenitis	385 (0.15)	<0.0001	1.0 (ref)	ref
Duodenal intraepithelial lymphocytosis	146 (0.8)		6.15 (5.06–7.47)	<0.0001
Partial villous atrophy	104 (5.0)		37.66 (30.16–47.03)	<0.0001
Subtotal/total villous atrophy	183 (9.7)		78.57 (65.37–94.44)	<0.0001

Lymphocytic gastritis

- Antrum-dominant lymphocytic gastritis
 - Association with lymphocytic duodenitis or enteritis and villous atrophy (coeliac disease)
- **Corpus-dominant lymphocytic gastritis**
 - Usually caused by HP (antibiotics may heal this type of gastritis also when HP-negative)

Lymphocytic gastritis

Propionibacterium acnes overabundance and natural killer group 2 member D system activation in corpus-dominant lymphocytic gastritis

Ana Montalban-Arques,^{1,2} Philipp Wurm,^{1,2} Slave Trajanoski,³ Silvia Schauer,¹ Sabine Kienesberger,^{4,5} Bettina Halwachs,^{1,2,5} Christoph Högenauer,^{2,6} Cord Langner¹ and Gregor Gorkiewicz^{1,2,5,*}

Comparative microbiota analysis of specimens from LyG, H. pylori gastritis and healthy controls precluded involvement of H. pylori in LyG but identified Propionibacterium acnes as possible disease trigger.

**Do we need a special
stain to detect
Helicobacter pylori?**

Assessment of different methods for staining *Helicobacter pylori* in endoscopic gastric biopsies

Medizinische Universität Graz

Jehoram T. Anim¹, Nabil Al-Sobkie², Asha Prasad¹, Bency John¹,
Prem N. Sharma³, Ibtissam Al-Hamar¹

We conclude that H&E is adequate for the initial assessment of gastric biopsied in symptomatic upper gastrointestinal patients (it is a well-tested, cheap and easy staining method).

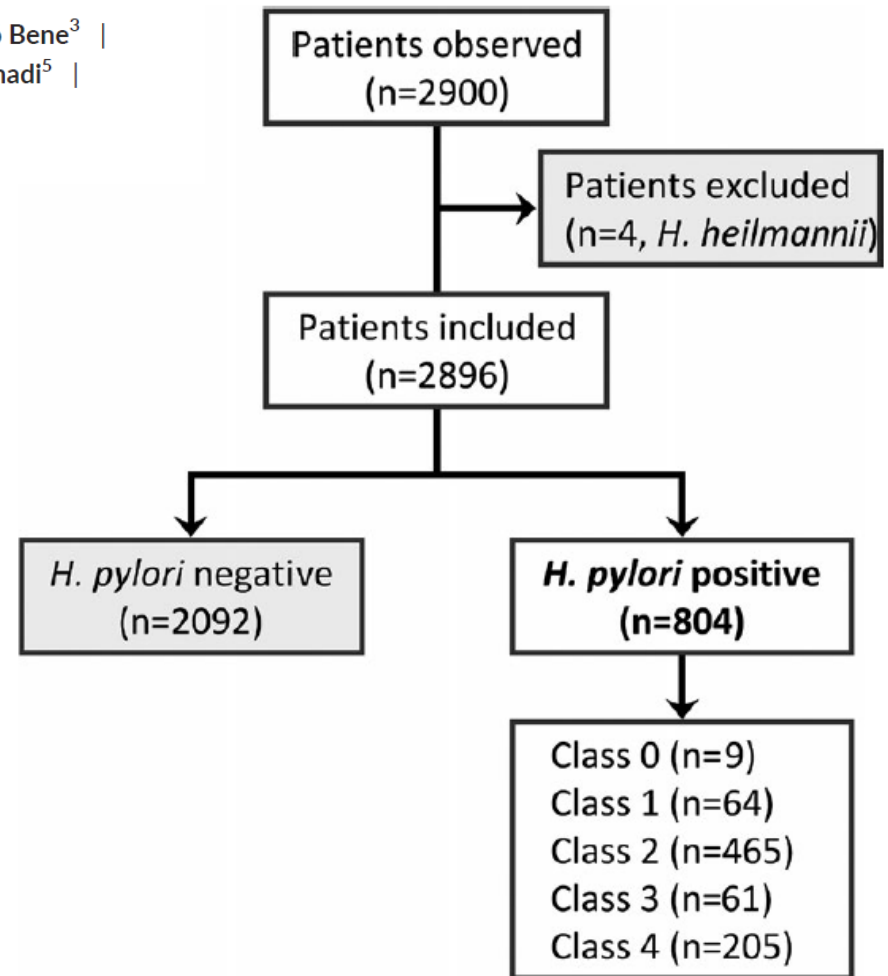

When the density of the organism is expected to be low, we recommend addition of silver staining because of its high sensitivity and low costs.

Sensitivity of *Helicobacter pylori* detection by Giemsa staining is poor in comparison with immunohistochemistry and fluorescent in situ hybridization and strongly depends on inflammatory activity

Éva Kocsmár¹ | Ildikó Szirtes¹ | Zsófia Kramer¹ | Attila Szijártó² | László Bene³ | György Miklós Buzás⁴ | István Kenessey¹ | Peter Bronsert^{5,6} | Agnes Csanadi⁵ | Lisa Lutz⁵ | Martin Werner⁵ | Ulrich Friedrich Wellner^{6,7} | András Kiss¹ | Zsuzsa Schaff¹ | Gábor Lotz¹ 

	Giemsa		IHC	
2896 cases	+	687 (23.7%)	+	662 (22.8%)
				-
	-	2209 (76.3%)	+	133 (4.6%)
				-

Sensitivity of *Helicobacter pylori* detection by Giemsa staining is poor in comparison with immunohistochemistry and fluorescent in situ hybridization and strongly depends on inflammatory activity

Éva Kocsmár¹ | Ildikó Szirtes¹ | Zsófia Kramer¹ | Attila Szijártó² | László Bene³ | György Miklós Buzás⁴ | István Kenessey¹ | Peter Bronsert^{5,6} | Agnes Csanadi⁵ | Lisa Lutz⁵ | Martin Werner⁵ | Ulrich Friedrich Wellner^{6,7} | András Kiss¹ | Zsuzsa Schaff¹ | Gábor Lotz¹ 

TABLE 2 Results of the studied stainings by statistical classes in the *Helicobacter pylori*-positive cases. Greatly decreased proportions of positive cases are outlined in bold

<i>H. pylori</i> -positive cases (n=804)		Giemsa		IHC		FISH	
		-	+	-	+	-	+
No chronic gastritis	0	6 (67%)	3 (33%)	1 (12%)	8 (88%)	1 (12%)	8 (88%)
Chronic nonactive gastritis without structural alteration	1	36 (56%)	28 (44%)	1 (1.5%)	63 (98.5%)	4 (6%)	60 (94%)
Chronic active gastritis without structural alteration	2	32 (7%)	433 (93%)	3 (0.6%)	462 (99.4%)	0 (0%)	465 (100%)
Chronic nonactive gastritis with structural alteration	3	47 (77%)	14 (23%)	3 (5%)	58 (95%)	8 (13%)	53 (87%)
Chronic active gastritis with structural alteration	4	17 (8%)	188 (92%)	1 (0.5%)	204 (99.5%)	3 (1.5%)	202 (98.5%)

Appropriate Use of Special Stains for Identifying *Helicobacter pylori*

Recommendations From the Rodger C. Haggitt Gastrointestinal Pathology Society

Medizinische Universität Graz

Kenneth P. Batts, MD,* Scott Ketover, MD,† Sanjay Kakar, MD,‡ Alyssa M. Krasinskas, MD,§
 Kisha A. Mitchell, MD,|| Rebecca Wilcox, MD,¶ Maria Westerhoff, MD,# Joseph Rank, MD,**
 Joanna Gibson, MD,|| Anthony R. Mattia, MD,†† Oscar W. Cummings, MD,‡‡
 Jon M. Davison, MD,§§ Bita V. Naini, MD,||| Sarah M. Dry, MD,|||
 and Rhonda K. Yantiss, MD¶¶

TABLE 1. GIPS Recommendations for Use of Ancillary Stains in Detection of *H. pylori*

Morphologic Findings	GIPS Recommendations For Special Stains*
Normal gastric mucosa	Not indicated
Chemical (reactive) gastropathy	Not indicated if chemical injury is only abnormality Appropriate if superimposed chronic gastritis is present
Chronic active gastritis	Not indicated if H&E demonstrates organisms Appropriate if H&E is negative for <i>H. pylori</i> Low yield if serologic studies are known to be negative
Chronic inactive gastritis	Not indicated if serologic studies are known to be negative, but probably justified in most other cases Appropriate if gastroduodenal ulcers are present Appropriate if gastric MALT-type lymphoma or adenocarcinoma is present Appropriate if duodenal lymphocytosis is present Appropriate in patients with prior <i>H. pylori</i> treatment Appropriate in high-risk demographic areas
Lymphocytic gastritis	Appropriate
Granulomatous gastritis	Unclear utility; no recommendation at this time
Eosinophilic gastritis	Unclear utility; no recommendation at this time
Fundic gland polyps	Not indicated
Hyperplastic polyps	Generally not indicated; ancillary stains may be considered if chronic inflammation is present and other biopsies are lacking
Isolated chronic active carditis	Appropriate
Isolated chronic inactive carditis	Not indicated, unless gastric biopsies are unavailable and/or serologic studies are positive
Barrett esophagus	Not indicated
Duodenal biopsies	Not indicated in overwhelming majority of cases

*We recommend use of immunohistochemistry as the preferred ancillary staining method.

How can we do it?

- The approach needs to follow the respective national guidelines (in Germany: Giemsa + PAS for all gastric biopsies)
- It should be guided by the expected regional prevalence of HP
- HP diagnosis is feasible on H&E stained sections (provided there is enough haematoxylin included) and can be used as initial stain in low prevalence countries
- In cases with active gastritis (or at least moderate chronic inactive gastritis) and after HP eradication therapy a special stain should be performed (today preferably immunohistochemistry)

The differential diagnosis of *Helicobacter pylori* negative gastritis

Hala El-Zimaity¹ • Won-Tak Choi² • Gregory Y. Lauwers³ • Robert Riddell⁴

Table 1 *H. pylori* negative gastritis

Group	
A. Failure to detect <i>H. pylori</i> (“false negative”)	<ol style="list-style-type: none"> 1. Non-use of special stains 2. Insufficient biopsy sampling 3. Biopsy post-treatment
B. <i>H. pylori</i> negative gastritis	<ol style="list-style-type: none"> 1. Lymphocytic gastritis 2. Collagenous gastritis 3. Atrophic gastritis <ul style="list-style-type: none"> • Autoimmune gastritis • <i>H. pylori</i>-associated atrophic gastritis 4. Non-<i>H. pylori</i> infectious gastritis <ul style="list-style-type: none"> • Viral (EBV, CMV) • Bacterial (non-<i>H. pylori</i>, <i>Helicobacter</i>, <i>Syphilis</i>, <i>Enterococcus</i>, etc.) 5. Category	Subcategory	Differential Diagnoses	
Prominent lamina propria inflammation	Lymphoplasmacytic	<i>H. pylori</i> gastritis Syphilitic gastritis	
	Lymphocytic	Epstein-Barr virus-associated gastritis lymphomatoid (natural Killer cell) gastroenteropathy	
	Neutrophilic	Phlegmonous gastritis (bacterial)	
Limited lamina propria inflammation	Granulomatous and histiocytic	<i>Infectious:</i> <i>Mycobacterium</i> (tuberculosis, avis, atypical) <i>Tropheryma whippelii</i>	
		Fungi	
		Parasites	
		<i>Non-infectious:</i> Crohn’s disease Sarcoidosis Foreign body granuloma	
		<i>Other etiologies:</i> Xanthogranulomatous gastritis Congenital immune disorders Vasculitis Idiopathic	
		Viral inclusions	CMV gastritis HSV gastritis Adenovirus

The differential diagnosis of *Helicobacter pylori* negative gastritis

Hala El-Zimaity¹ · Won-Tak Choi² · Gregory Y. Lauwers³ · Robert Riddell⁴

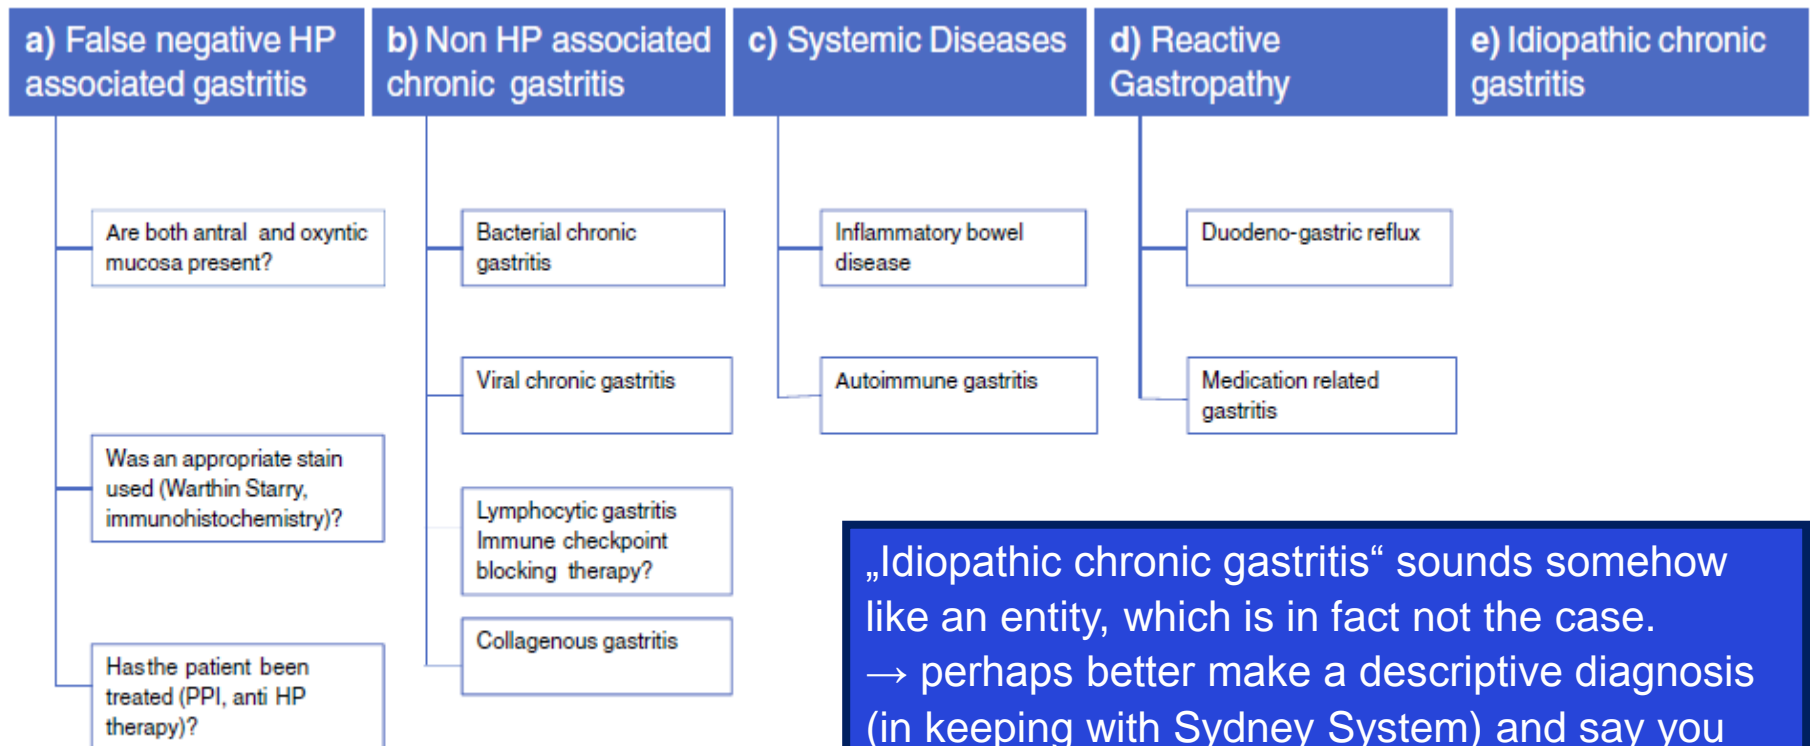

Fig. 13 Algorithm for dealing with *H. pylori* negative gastritis

„Idiopathic chronic gastritis“ sounds somehow like an entity, which is in fact not the case. → perhaps better make a descriptive diagnosis (in keeping with Sydney System) and say you are unable to provide an aetiological clue (and perhaps you are able to exclude certain aetiologies which may be of help)

Autoimmune gastritis

- Autoantibodies directed against the proton pump of parietal cells
- T-cell mediated gland destruction within the oxyntic mucosa

Association of autoimmune type atrophic corpus gastritis with *Helicobacter pylori* infection

Lea Irene Veijola, Aino Mirjam Oksanen, Pentti Ilmari Sipponen, Hilpi Iris Kaarina Rautelin

- **Autoimmune gastritis in association with HP infection**
 - Higher patient age (females = males)
 - Active HP gastritis / post-HP gastritis
 - Positive HP serology
- **Autoimmune gastritis not in association with HP infection**
 - Younger patient age (females >> males)
 - No HP / Post-HP gastritis and negative HP serology
 - Other autoimmune diseases: autoimmune thyroiditis, diabetes mellitus type 1, Sjögren's syndrome

Autoimmune gastritis

Medizinische Universität Graz

Autoimmune gastritis

Medizinische Universität Graz

Autoimmune gastritis

Medizinische Universität Graz

**Pseudopyloric
metaplasia**

**Pancreatic and intestinal
metaplasia**

Die aktive präatrophische Autoimmungastritis

Key morphological features of active pre-atrophic autoimmune gastritis:

1. Lymphocytic infiltration of the glands of the oxyntic (corpus and fundus) mucosa
2. Focal destruction in individual oxyntic glands
3. Reactive hypertrophy of the parietal cells

ANATOMICAL PATHOLOGY

Autoimmune gastritis: novel clues to histological diagnosis

MARK BETTINGTON*† AND IAN BROWN*

*Envoi Specialist Pathologists, and †The Queensland Institute of Medical Research, Brisbane, Queensland, Australia

Table 3 Histological features in AIG, HPG and MAG

	Lymphocyte infiltration of crypt epithelium	Neutrophil cryptitis	Basal lymphoid aggregates	Gland architectural disturbance	Thickened muscularis mucosae
AIG	98.0%	44.2%	82.7%	86.5%	92.9%
HPG	23.1%	86.5%	42.3%	1.9%	7.5%
MAG	14.0%	12.5%	62.5%	100.0%	92.3%

AIG, autoimmune gastritis; HPG, *H. pylori* gastritis; MAG, multifocal atrophic gastritis.**Table 2** Results of eosinophil counts in each study group

	Mean eosinophils (range)	Mean eosinophils/3HPF (range)	Eosinophils ≥ 30 /HPF
AIG	34.5 (2–89)	79.4 (4–222)	24 (46.1%)
NGB	3.3 (0–11)	6.2 (0–23)	0 (0%)
HPG	8.8 (2–41)	21.1 (3–116)	1 (1.9%)
MAG	10.7 (1–34)	26.6 (3–85)	1 (6.3%)
CG	4.4 (1–12)	9.1 (1–22)	0 (0%)
<i>p</i> value	$p < 0.001$	$p < 0.001$	

AIG, autoimmune gastritis; CG, chronic gastritis; HPF, high power field; HPG, *H. pylori* gastritis; MAG, multifocal atrophic gastritis; NGB, normal gastric body mucosa.

Intestinal metaplasia was seen, by definition, in every case of MAG and comprised 10–50% of the biopsy area in four cases (25%) and >50% in 12 cases (75%). By contrast, while all cases of AIG displayed gastric pseudo-pyloric gland metaplasia, intestinal metaplasia was not identified in five cases (9.6%) and was seen in <10% of the biopsy area in a further seven cases (13.5%). Thirty-one (59.6%) cases had 10–50% intestinal metaplasia and nine cases (17.3%) had >50% intestinal metaplasia. Intestinal metaplasia was present (10–50%) in the gastric body biopsies in HPG in three cases (6%). The gastric antrum also displayed intestinal metaplasia in these cases. Pancreatic metaplasia (Fig. 3A) ranging from 5% to 20% of the total biopsy area was present in 11 (21.2%) AIG cases, but was not seen in NGB, HPG or MAG cases in this study.

As it was part of the inclusion criteria for this study, gastric antral biopsies were examined in all AIG cases. A well-developed reactive gastropathy pattern (Fig. 3B) was found in 15 cases (29%) while the remainder displayed no significant abnormality.

Pancreatic Acinar Cell Metaplasia in Autoimmune Gastritis

Nirag C. Jhala, MD; Mario Montemor, MD; Darshana Jhala, MD; Lin Lu, MD; Lynya Talley, PhD; Marian M. Haber, MD; Juan Lechago, MD, PhD

Table 1. Histologic Findings in Various Groups*

Group	Acute Inflammation	Chronic Inflammation	Helicobacter pylori	ECL Hyperplasia	Intestinal Metaplasia	Pyloric Metaplasia	Pancreatic Metaplasia
AIG (n = 18)	3	14	3	18†	13	16	9
MAG (n = 15)	6	15	5	0	15	13	1
CAG (n = 30)	27	30	25	0	3	0	0
Unremarkable (n = 37)	0	5	1	0	1	0	1

* AIG indicates autoimmune gastritis; MAG, multifocal atrophic gastritis; CAG, chronic active gastritis; and ECL, enterochromaffin-like cells. † Includes 8 patients with micronodular hyperplasia and 2 patients with carcinoid tumor.

Table 3. Association of Autoimmune Gastritis to Pancreatic Metaplasia

	Pancreatic Acinar Cell Metaplasia Present	Pancreatic Acinar Cell Metaplasia Absent	Total
Autoimmune gastritis	9	9	18
Nonautoimmune gastritis	2	80	82

The „**active cell**“ in autoimmune gastritis is the T cell

The presence of **acute inflammation** does **not** render information regarding the **activity of disease**

Therefore, the **Sydney System** should **not** be used for reporting

Autoimmune gastritis

G cell hyperplasia in antrum

ECL cell hyperplasia in oxyntic mucosa

Hyperplasia-dysplasia-neoplasia- sequence of ECL cell proliferation

Simple	Increase (>2 fold) in ECL cell number
Linear	Chains of at least 5 ECL cells growing within the gastric glands
Micronodular	Clusters of at least 5 cells within the deep lamina propria (recognizable on H&E)
Adenomatoid	Collections of five or more ECL cell micronodules (intact basal membrane)
Dysplasia	Fusing or enlarging micronodules (150µm – 500µm)
Neoplasia (NET, carcinoid)	Lesions larger than 500µm or invasion into the submucosa

Multiple polypoid lesions in the proximal stomach (body and fundus) of a 67-year-old male.

What is your diagnosis?

Gastric Lesions in Patients With Autoimmune Metaplastic Atrophic Gastritis (AMAG) in a Tertiary Care Setting

Jason Y. Park, MD, PhD,* Toby C. Cornish, MD, PhD,† Dora Lam-Himlin, MD,‡
Chanjuan Shi, MD, PhD,§ and Elizabeth Montgomery, MD†

TABLE 3. Endoscopically Identified Lesions Arising in a Background of Autoimmune Metaplastic Atrophic Gastritis (n = 240)

Features (n)	Additional Descriptors
Polyps (179)	
Hyperplastic (138)	
Oxyntic-gland pseudopolyp (20)	
Intestinal-type gastric adenoma (18)	
Pyloric gland adenoma (3)	One was initially classified as a hyperplastic polyp with changes indefinite for dysplasia
Adenocarcinomas (11)	
Poorly differentiated with signet ring cell features (4)	Youngest patient was 40-year-old at the time of diagnosis
Poorly differentiated without signet ring cell features (3)	
Moderate or moderate to poorly differentiated (4)	
Lymphoma (3)	
Extranodal marginal zone lymphoma (MALT type) (2)	<i>Helicobacter pylori</i> negative
Large B-cell lymphoma (1)	<i>Helicobacter pylori</i> negative; perivascular amyloid present
Well-differentiated neuroendocrine neoplasms (carcinoids) (46)	
Gastrointestinal stromal tumor (1)	

Polyps are seen in 75% of patients with autoimmune gastritis: hyperplastic polyps account for 77%, **oxyntic gland pseudopolyps for 11%**

Neuroendocrine tumours (NETs, carcinoids) are found in 19% of patients with autoimmune gastritis

The remaining lesions are adenomas (9%), adenocarcinomas (5%) and malignant lymphomas (1%)

Reactive gastropathy

- Antrum > oxyntic mucosa
- Two main causes (chemical injury to the mucosa)
 - Duodenogastric reflux (“reflux gastritis/gastropathy”)
 - Drugs (NSAIDs)

Reflux gastritis: distinct histopathological entity?

MF DIXON,* HJ O'CONNOR,† ATR AXON,† RFJG KING,‡ D JOHNSTON‡

*From the University Departments of *Pathology and †Surgery, and the ‡Gastroenterology Unit, General Infirmary at Leeds, Leeds*

■ Basic morphological features

- Foveolar hyperplasia (with mucin depletion and mild reactive nuclear changes)
- Ascending smooth muscle fibres in the lamina propria
- Vasodilation and congestion of superficial mucosal capillaries
- Stromal oedema
- Paucity of both acute and chronic inflammatory cells

Gastric mucosal atrophy: interobserver consistency using new criteria for classification and grading

M. RUGGE†, P. CORREA‡, M. F. DIXON§, R. FIOCCA¶, T. HATTORI**, J. LECHAGO††, G. LEANDRO‡‡, A. B. PRICE§§, P. SIPPONEN¶¶, E. SOLCIA***, H. WATANABE††† & R. M. GENTA‡‡‡

Proposed classification

Most participants subscribed to the following statements.

- (a) Two main types of atrophy can be recognized: one characterized by the loss of glands, accompanied by fibrosis or fibromuscular proliferation in the lamina propria, and one characterized by the replacement of the normal (native) glands with metaplastic glands (i.e. glands not normally belonging to that area).
- (b) By modifying the definition of atrophy from the ‘loss of glands’ to the ‘loss of appropriate glands’, both metaplastic and non-metaplastic atrophy would be included.
- (c) Both metaplastic and non-metaplastic atrophy can be allocated to one of three grades of severity, using grading criteria modelled on those suggested by the original and the updated Sydney System.^{6, 21}

**Kappa values für low-grade dysplasia are still unsatisfactory,
even for expert GI pathologists**

Gastric Cancer Risk in Patients With Premalignant Gastric Lesions: A Nationwide Cohort Study in the Netherlands

ANNEMARIE C. DE VRIES,* NICOLE C. T. VAN GRIEKEN,[‡] CASPAR W. N. LOOMAN,[§]
MARIËL K. CASPARIE,^{||} ESTHER DE VRIES,[§] GERRIT A. MEIJER,[‡] and ERNST J. KUIPERS*[¶]

*Department of Gastroenterology and Hepatology, [§]Department of Public Health, [¶]Department of Internal Medicine, Erasmus MC University Medical Center, Rotterdam; [‡]Department of Pathology, VU University Medical Center, Amsterdam; and ^{||}Prismant, Utrecht; The Netherlands

In total, 22,365 (24%) patients were diagnosed with atrophic gastritis, 61,707 (67%) with intestinal metaplasia, 7616 (8%) with mild-to-moderate dysplasia, and 562 (0.6%) with severe dysplasia.

The annual incidence of gastric cancer was 0.1% for patients with atrophic gastritis, 0.25% for intestinal metaplasia, 0.6% for mild-to-moderate dysplasia, and 6% for severe dysplasia within 5 years after diagnosis.

Incidence of gastric cancer among patients with gastric precancerous lesions: observational cohort study in a low risk Western population

Huan Song,¹ Isabella Guncha Ekheden,¹ Zongli Zheng,¹ Jan Ericsson,² Olof Nyrén,¹ Weimin Ye¹

Fig 2 | Cumulative incidence of gastric cancer among patients with different baseline diagnoses. First two years of follow-up excluded

“Our data predict that about 1 in 256 people with normal mucosa, 1 in 85 with gastritis, **1 in 50 with atrophic gastritis**, **1 in 39 with intestinal metaplasia**, and 1 in 19 with dysplasia will develop gastric cancer within 20 years after gastroscopy”

Risks and Predictors of Gastric Adenocarcinoma in Patients with Gastric Intestinal Metaplasia and Dysplasia: A Population-Based Study

Dan Li, MD¹, Marita C. Bautista, MD¹, Sheng-Fang Jiang, MS², Paras Daryani, MD¹, Marilyn Brackett³, Mary Anne Armstrong, MA², Yun-Yi Hung, PhD², Debbie Postlethwaite, RNP, MPH² and Uri Ladabaum, MD, MS⁴

Table 2. Follow-up of patients with gastric intestinal metaplasia and dysplasia

	Intestinal metaplasia	Low-grade dysplasia	High-grade dysplasia
Total number at baseline endoscopy, <i>n</i>	4,146	141	44
<i>Age at diagnosis of adenocarcinoma</i>			
Median	77	79	75
Interquartile range, years	70–80	73–83	72–79
<i>Gender</i>			
Female, <i>n</i> (%)	2,149 (51.8%)	71 (50.4%)	15 (34.1%)
Male, <i>n</i> (%)	1,997 (48.2%)	70 (49.6%)	29 (65.9%)
<i>Follow-up time, years</i>			
Median	7.1	6.1	0.14
Interquartile range, years	2.6–9.6	2–10.5	0–2
Number of gastric adenocarcinoma during first year, <i>n</i> (%)	20 (0.5%)	5 (3.5%)	26 (59.1%)
Number of gastric adenocarcinoma after first year, <i>n</i> (%)	17 (0.4%)	6 (4.3%)	2 (4.5%)
<i>Time to diagnosis of gastric adenocarcinoma (excluding cases during first year), years</i>			
Median	6.1	2.6	3.1
Interquartile range, years	4.7–6.8	1.4–8.9	2.5–3.7

The incidence rate of gastric adenocarcinoma was 0.72/1,000 person-years in patients with **intestinal metaplasia, with a relative risk of 2.56** (95% CI 1.49–4.10) compared with the Kaiser Permanente member population, and 7.7/1,000 person-years for low-grade dysplasia, with a relative risk of 25.6 (95% CI, 9.4–55.7).

Management of epithelial precancerous conditions and lesions in the stomach (MAPS II): European Society of Gastrointestinal Endoscopy (ESGE), European *Helicobacter* and Microbiota Study Group (EHMSG), European Society of Pathology (ESP), and Sociedade Portuguesa de Endoscopia Digestiva (SPED) guideline update 2019

Medizinische Universität Graz

RECOMMENDATION

9 Biopsies of at least two topographic sites (from both the antrum and the corpus, at the lesser and greater curvature of each) should be taken and clearly labelled in two separate vials. Additional biopsies of visible neoplastic suspicious lesions should be taken.

Moderate quality evidence, strong recommendation (94% agree [82% strongly or moderately agree]).

RECOMMENDATION

16 In patients with IM at a single location but with a family history of gastric cancer, or with incomplete IM, or with persistent *H. pylori* gastritis, endoscopic surveillance with CE and guided biopsies in 3 years' time may be considered.

Low quality evidence, weak recommendation (82% agree [76% strongly or moderately agree]).

RECOMMENDATION

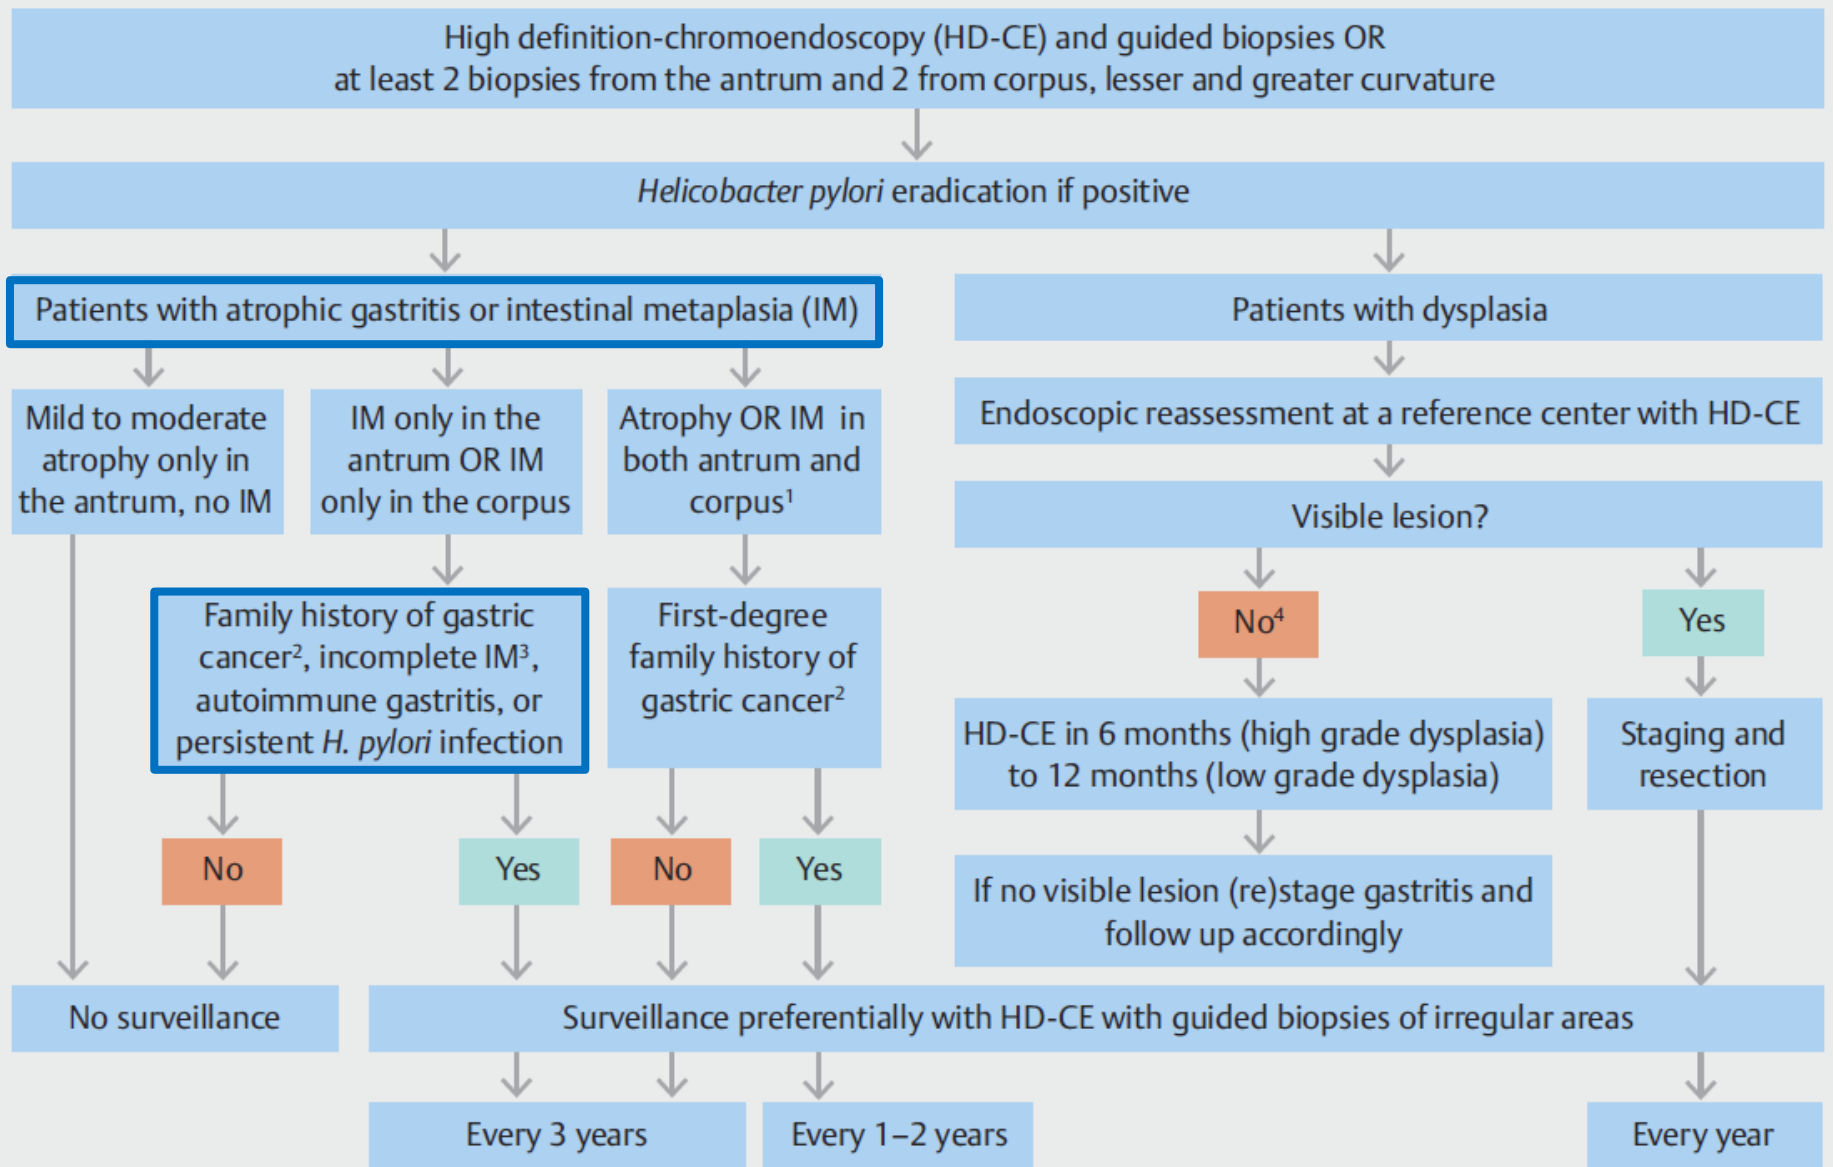

17 Patients with advanced stages of atrophic gastritis (severe atrophic changes or IM in both antrum and corpus, OLGA/OLGIM III/IV) should be followed up with a high quality endoscopy every 3 years.

Low quality evidence, strong recommendation (100% agree [94% strongly or moderately agree]).

RECOMMENDATION

18 Patients with advanced stages of atrophic gastritis and with a family history of gastric cancer may benefit from a more intensive follow-up (e.g. every 1–2 years after diagnosis).

Low quality evidence, weak recommendation (82% agree [65% strongly or moderately agree]).

¹ Advanced stages of atrophic gastritis warranting surveillance should be defined as significant (moderate to marked) atrophy or intestinal metaplasia (IM) affecting both antral and corpus mucosa or as OLGA/OLGIM stages III/IV. Mild atrophy without IM, even when affecting antrum and corpus, should not be considered to be an advanced stage of gastritis.

Take home messages

- The diagnosis of gastritis needs to include the aetiology of disease – mixed forms may occur and should be reported
- Diagnosis of HP on H&E stained slides is feasible (but ancillary techniques should be used if appropriate)
- The Sydney System should be used for the reporting of HP gastritis, post-HP gastritis and gastritis with uncertain aetiology (it should **not** be used for autoimmune gastritis and reactive gastropathy)
- Pseudopolyps in autoimmune gastritis represent an important diagnostic pitfall (DD hyperplastic polyp, NET)
- Atrophy and intestinal metaplasia (incomplete versus complete) are important preneoplastic lesions: chronic inflammation – metaplasia – dysplasia – carcinoma sequence (with follow-up according to the recently updated MAPS Guidelines)
